Introduction

Winslips is a lottery tool that makes your winning ambitions more achievable.

The application is powered by a brand-new and fully enhanced version of two extremely reliable lottery systems that we previously developed: the budget-friendly "One Ticket System" and the "Inverted Lottery System".

Chances are you've never heard of the One Ticket System before, but that's because we optimized it for just a few jackpot games. Today, that technical limitation is no longer a factor. Hundreds of lottery drawing games are now fully supported.

The Inverted Lottery System is of course much better known. We developed this highly successful number reduction system for plenty of lottery games, and it was used by literally thousands of satisfied lottery players worldwide.

Both systems are now integrated into ONE easy-to-use lottery program.

Winslips is web-based and runs online in your favourite web browser. There's no need to install anything. Just log into your membership page and proceed from there.

With the exception of digits games [0-9], WinSlips covers all major pick 4, pick 5, pick 6, AND pick 7 lottery jackpot games. For a complete list, please visit this [web-page](#) for the latest updates.

Some parts of this manual may resemble some parts of the original systems. However, the program itself, the in-depth description of its functionalities, and the added screen-shots to illustrate all the new features are of course completely new.

Please understand that winslips.com is in a constant evolutionary state. Some new features may be added at any time, some of the existing features may get a new upgrade. Since the program runs online, there's no need to reinstall anything to activate those changes. Winslips' most recent version is automatically loaded into your web-browser.

Important!

It takes about 20 seconds for the Winslips Application to load in your web-browser. In case you're experiencing some sloppiness when using the Winslips Application, or when you see that the Winslips Application doesn't load at all, then most likely you're using an older or incompatible web-browser.

You can easily solve this by using another, more modern, web-browser like [FireFox](#). [FireFox](#) is completely free and is available in many [different languages](#).

Chapter 1: A Cure To Win ...

Several jackpot winners told me a nice little secret. It is something I knew already for a very long time but hadn't fully realized. They told me that - although they successfully picked ALL the winning numbers - they never felt like they ever did... The winning numbers picked them, they said.

Some truth lies in it!

When you look at the odds, lottery games are practically impossible to win. Yet, some folks are living proof that this is not the case, quite the contrary.

Take Adeline and Eugene Angelo for example, a retired couple from New York. They won \$5 million in the New York Lotto, **one year after** they had won their first \$2.5 million.

Also pretty amazing: the Gallina family. One hour after winning \$126,000 in their local Fantasy Five game, they won \$17 million in California's SuperLotto Plus. Two jackpots within one hour!!!

And let's not forget Joan Ginther, a 63-year-old woman from Texas who won 4 major jackpot prizes for a total of \$20.4 million. Now that's mind-blowing!

Is there a secret to win big? Is there more between heaven and earth than what meets the eye?

After reading these incredible multiple-win stories, one could easily think there must be. Some say that positive expectations make things happen. Others say that "not expecting" works more or less in the same, but opposite way.

Personally, I believe that "not expecting" is a reflection of your subconscious mind: it knows it does something wrong.

I also believe that I can cure your subconscious mind!

In just a few moments from now, you'll be able to exploit a 100% fail-safe **Number Reduction Platform** that makes it a lot easier to pick the winning numbers.

You'll also discover an amazingly accurate **Number Verification Picker** that can be used in conjunction with the above mentioned reduction platform. If you prefer not to, you can still use The Picker as the stand-alone One Ticket System.

I can't promise you a win each time you play. That's impossible with just a few tickets. But rest assured, those few tickets are the best lottery tickets your money can buy, I guarantee you!

Chapter 2: The Need For a Different Kind of System!

I don't know if you've ever tried a lottery system before, but if you did then let me ask you this eye-opening question ...

Has it ever occurred to you that most lottery systems require you to make a series of tough decisions BEFORE they actually start doing something?

Let me show you a couple of "BEFORE"-systems – *that's how I call them* – and why they are blocking you from winning a major jackpot prize ...

- **Wheels:** Before a wheel can produce a jackpot winning ticket, you need to decide which numbers you're going to put into the wheel.
- **Number filters:** Before filtering software can predict a winning combo, you have to choose the correct filters from a wide range of available filters.
- **Statistics:** Before a statistical analysis tool can produce a reliable prediction, you have to pick the correct range of past draw results upon which the statistical analysis will be based.

Now Ask Yourself...

Can you win the "grand prize" when you fail to put all the winning numbers into that wheel? Can you possibly win the jackpot when your wrongly chosen filters cut away one or more of the winning numbers? Can you hit the big one when your statistical analysis tool made you decide that some of the actual winning numbers were too cold to be drawn or too hot to come up again?

Can YOU?

You see, the problem is that any FIRST error on the part of the decision making instantly provokes a fatal SECOND error on the part of the system...

That's like flying around in a twin-engined airplane, where one engine automatically quits when the other one fails. What's the point of having 2 engines then?

Now let me ask you...

Wouldn't you prefer a lotto system whose engines never quit? A system that **does something good for you** EACH AND EVERY TIME you use it, and this without the need to make a critical "BEFORE"-decision?

Of course you would!

Let's proceed to the next chapter and see what the options are ...

Chapter 3: Making Things Easier ...

As we all know, lotto is a game where you have to pick an x-amount of numbers from a larger group of numbers. The fewer numbers you have to match, and the fewer numbers you have to choose from, the less difficult it becomes to "predict" the winning numbers.

To illustrate what I just said:

- Lotto 5/40 is easier than lotto 6/40 (you have to match fewer numbers)
- Lotto 5/40 is easier than lotto 5/50 (you have fewer numbers to choose from)

So the options to make it easier to win a lotto game are either

- Option 1
Finding a fail-safe way to "predict with absolute certainty" one or more of the next draws' winning numbers so you have to match fewer numbers
- Option 2
Finding a fail-safe way to shrink the original pool of numbers so you have fewer numbers to choose from

Option 1 can be achieved by playing a sequential wheel and has been outlined in my best-selling book: ["If you can't win the lottery then change its rules"](#). By playing all the numbers in a very specific way, trapping the winning numbers isn't a matter of skill or luck, ... it becomes a mathematical certainty. *(To preserve the integrity and originality of this user manual, I won't get into this any further, although I'd like to mention that a small syndicate of university professors won £ 5 million by applying the very same logics)*

Option 2 then...

Having fewer numbers to choose from ...

Is it possible to shrink the original pool of numbers from which the winning numbers are chosen, in a non-destructive way, making it easier for a lotto player to decide which ones to pick?

It certainly is possible, with WINSLIPS!

And because the system's number reduction platform is **100% fail-safe** you'll have a far better shot at winning the jackpot each and every time you decide to play.

Please note that a "far better" shot is not necessarily an "easy" shot. We're dealing with big lottery games here. Luck will always remain an additional factor, one can not exclude that. But luck needs to be created as well, so let's move onto the next chapter ...

Chapter 4: Basic Set-Up!

I have developed WINSLIPS with one thing in mind: it had to be a tool that makes it easier to find the winning numbers, or - if you allow me to be a bit controversial - it had to be a tool to let the winning numbers find you.

To explain you how it works, let's take a closer look at the world's best known jackpot game: Powerball USA.

Once you understand how WinSlips works for that game, it's quite easy to make the switch to other games.

The first question you need to ask yourself is this:

"How many numbers are drawn from the main pool of numbers?"

With Powerball USA, 5 numbers are drawn from ONE pool of numbers, so Powerball is basically a pick 5 lotto. The fact that one extra ball is drawn from a separate pool of numbers doesn't make it a pick 6 lotto. It's more like a Pick 5+1 lotto.

The reason why that difference is so important is because, after you log into your membership page, you have to select your type of lotto FIRST. So the first thing you need to do is selecting "pick 5".

The second question you need to ask yourself is:

"How many lottery balls are spinning around in the **main** drum?"

With Powerball USA, there are 69 numbers in the main lottery drum, so select that amount of numbers: "69 numbers".

Pick 5 ▼ from 45 numbers ▼

Panel Layout:

Panel Indent:

Panel		
1	2	3
7	8	9
13	14	15
19	20	21
25	26	27
31	32	33
37	38	39
43	44	45

Pick 5

39 numbers
40 numbers
41 numbers
42 numbers
43 numbers
45 numbers
47 numbers
48 numbers
49 numbers
50 numbers
52 numbers
54 numbers
55 numbers
56 numbers
59 numbers
60 numbers
69 numbers
75 numbers
80 numbers
90 numbers

Next, you need to figure out if your lotto game involves the draw of one or more extra numbers from a separate pool of numbers. With Powerball USA this is clearly the case, so check-mark the option "Add extra bonus number(s) from separate pool".

Pick 5 ▼ from 69 numbers ▼ ☒ Add extra bonus number(s) from separate pool

Because you ticked the previous option, a new drop-down menu appears from which you have to select the amount of extra balls that will be drawn (*just 1 for Powerball USA*) from a predefined range of possible numbers. (*That's 26 possible numbers for Powerball USA*)

Pick 5 ▼ from 69 numbers ▼

and 1 ▼ from 26 numbers ▼

Next, you need to "tell" the software how each individual game panel on your local lottery play-slip looks like. Although Powerball USA is the same 5/69 + 1/26 game across all the participating states, there are some **local** lay-out differences!

At the time of updating this manual, and looking at Washington DC's Powerball play-slip, the first row of each individual game panel starts with 1 and ends with 9. For Florida's Powerball, that first row starts with 1 and ends with 7.

For the purpose of this manual, just imagine we're playing Powerball in Washington DC, so select "9 columns" from the panel layout options.

Pick 5 ▼ from 69 numbers ▼
 and 1 ▼ from 26 numbers ▼
 Panel Layout: 9 columns ▼

And there you have it ... the exact same lay-out of one **main** panel for Washington DC Powerball.

Panel 1/1								
1	2	3	4	5	6	7	8	9
10	11	12	13	14	15	16	17	18
19	20	21	22	23	24	25	26	27
28	29	30	31	32	33	34	35	36
37	38	39	40	41	42	43	44	45
46	47	48	49	50	51	52	53	54
55	56	57	58	59	60	61	62	63
64	65	66	67	68	69			

Side-note!

We don't need an extra panel below the main panel to pick our powerball. That ball will be picked by the winslips program but the outcome remains a matter of pure luck.

Regardless of what type of lotto game you play, the winslips program only focuses on the main numbers.

So far so good for the basic set-up.

Next, let's have a closer look at that basic panel, and in particular at its rows and columns. It's really important to understand that **different numbers** can share the same row or column ...

Chapter 5: Rows and Columns

When you look at a panel, you'll notice that each number is located on exactly one row and one column.

If the term "row" or "column" confuses you, then simply try to see rows as horizontal lines and columns as vertical lines.

column

Panel 1/1								
1	2	3	4	5	6	7	8	9
10	11	12	13	14	15	16	17	18
19	20	21	22	23	24	25	26	27
28	29	30	31	32	33	34	35	36
37	38	39	40	41	42	43	44	45
46	47	48	49	50	51	52	53	54
55	56	57	58	59	60	61	62	63
64	65	66	67	68	69			

column

When 5 numbers are drawn, **2, 3, 4** and even **all 5** numbers can share the same row or column.

In the example below you can clearly see that numbers 10, 14, 16, 34 and 51 are located on 3 rows and 4 columns.

4 columns

Panel 1/1								
1	2	3	4	5	6	7	8	9
10	11	12	13	14	15	16	17	18
19	20	21	22	23	24	25	26	27
28	29	30	31	32	33	34	35	36
37	38	39	40	41	42	43	44	45
46	47	48	49	50	51	52	53	54
55	56	57	58	59	60	61	62	63
64	65	66	67	68	69			

4 columns

Now that you understand all that, let's move to the next chapter to see the WinSlips program in action ...

Chapter 6: WinSlips in Action

Winslips has 2 main components. One component is a fail-safe Number Reduction Platform, the other component is an amazingly accurate Number Verification Picker. Both components work nicely together.

Component 1 : the Number Reduction Platform

When you hit the **"INVERT"**-button, the main panel transforms into a fail-safe number reduction platform.

Initially, **only one panel is visible** – *the first panel* - but depending on the type of lotto you play (*pick 4, pick 5, pick 6 or pick 7*) that platform consist of either 5, 6, 7 or 8 panels.

For Powerball 5/69 or any other Pick 5 lotto, you'll get 6 panels

P2 »

Panel 1/6							
1	2	3	4	5	6	7	
10	11	12	13	14	15	16	17
19	20		22	23	24	25	26 27
	29	30	31	32	33	34	35 36
	38	39		41			45
46	47	48		50	51	52	53 54
55	56	57	58	59		61	62 63
64	65	66	67	68	69		

You can navigate between the different panels by clicking on the **Panel Navigation Buttons**

« P1

P3 »

Panel 2/6							
1	2		4		6	8	9

Initial Observation!

When you navigate between the different panels, you'll notice that many numbers are missing from each panel. There's a very good reason for that. Here's that very good and "guaranteed" reason ...

Guaranteed!

Although many numbers are missing from each panel, you are guaranteed that at least 1 panel contains ALL 5 winning numbers (*no matter what the outcome of the next lottery draw will be*). Those winning numbers are in there ... **ALWAYS!**

Not important, but in case you wonder...

This guarantee is obtained by the implementation of an exact combinatorial grouping method!

Your Benefit...

Winning numbers come in clusters, and because many numbers are missing from each panel, the platform gently forces you to avoid playing a (missing) number that wouldn't be part of the winning cluster anyway. This makes it easier for you to pick a possible jackpot winning combination.

Also, when picking 5 numbers from a smaller field of numbers, there is less room for error. Remember, at least 1 panel – *usually 2 or 3 panels* – is guaranteed to contain ALL the winning numbers.

Component 2 : The Number Verification Picker

The second component of WinSlips is an amazingly accurate Number Verification Picker.

All it takes is a simple click! (*see circled area in the example above*)

That number picker will pick a perfectly distributed number combination for you, and it does that in a very particular way:

- Firstly, it will **ALWAYS** pick a combination that has been verified to match the best **pre-calculated probabilities** (full explanation half a page below).

- Secondly, it picks verified combinations from any bigger or smaller range of pre-calculated probabilities at your command.
- Thirdly, it will NEVER pick a missing number to preserve your benefit of using a fail-safe number reduction platform.
- And lastly, when you click on The Picker, it will inform you how many odds/evens and lows/highs are within the presented selection of numbers.
(New since February 2018!)

*P.S. You can force The Picker to AVOID selecting combinations that have all odd, all even, all high or all low numbers. To do this, simply select the two optional white checkboxes (then hit The Picker again). More on this on **Page 25** of this user manual.*

Let's focus on the **pre-calculated probabilities** FIRST!

To explain you what the "pre-calculated probabilities" are, let's click the **"CLEAR"**-button to reset our Washington DC Powerball panels.

We're now back to 1 panel and no numbers are missing. We can clearly see all 69 numbers spread among 9 columns and 8 rows.

9 columns

Panel 1/1								
1	2	3	4	5	6	7	8	9
10	11	12	13	14	15	16	17	18
19	20	21	22	23	24	25	26	27
28	29	30	31	32	33	34	35	36
37	38	39	40	41	42	43	44	45
46	47	48	49	50	51	52	53	54
55	56	57	58	59	60	61	62	63
64	65	66	67	68	69			

8 rows

Now let me ask ...

Suppose you could only afford to play one ticket for the next draw, how would you hand-pick 5 main numbers from that panel?

If you had to choose between the following options, would you ...

- pick 5 numbers that are located on 5 rows?
- pick 5 numbers that are located on 4 rows?
- pick 5 numbers that are located on 3 rows?
- pick 5 numbers that are located on 2 rows?
- pick 5 numbers that are located on 1 row?

With pure mathematics, we can calculate the exact odds for each of the 5 possible scenarios to happen. For any given configuration, WinSlips' interface has been programmed to show you exactly what these odds are ...

The lower the odds, the better the chance that something will happen. For **Washington DC Powerball**, the best odds tell us that the 5 winning numbers are more likely to be located on 4 rows than on 1, 2, 3 or 5 rows.

The chance that the 5 numbers will be located on 4 rows is 1 in 1.91 or roughly once every 2 draws

Now, it is also an absolute certainty that the 5 winning numbers will be located on minimum 1 and maximum 5 different columns. The options are:

- 5 numbers located on 5 columns
- 5 numbers located on 4 columns
- 5 numbers located on 3 columns
- 5 numbers located on 2 columns
- 5 numbers located on 1 column

Again, based on pure math, the WinSlips System shows you exactly what these odds are ...

COLUMNS

☐		5 cols = 1: 3.38
☐		4 cols = 1: 1.94
☐		3 cols = 1: 5.65
☐		2 cols = 1: 91.83
☐		1 col = 1: 28166.7

As you can see, the best odds for Washington DC Powerball tell us that the 5 main winning numbers have a better chance to be located on 4 different columns than on 1, 2, 3 or 5 columns.

Selecting a bigger or smaller range of pre-calculated probabilities ...

By Default, WinSlips automatically pre-selects any probability that is better than 1 in 10.

ROWS

☒	=====	5 rows = 1: 4.29
☒	====	4 rows = 1: 1.91
☒	===	3 rows = 1: 4.44
☐	==	2 rows = 1: 57.71
☐	=	1 row = 1: 12655.98

COLUMNS

☒		5 cols = 1: 3.38
☒		4 cols = 1: 1.94
☒		3 cols = 1: 5.65
☐		2 cols = 1: 91.83
☐		1 col = 1: 28166.7

When you put The Number Picker at work, it will automatically select a random combination that matches those probabilities.

Sticking to our example for Washington DC Powerball, when you engage The Picker in default mode, the selected numbers will always be located on 3, 4 or 5 rows AND 3, 4 or 5 columns.

The way the verification process works is as follows ...

- The Picker first picks a totally random combination.
- The program then verifies if the picked combination matches the pre-selected probabilities.
- If it finds a match, the program keeps the picked combination.
- If there's no match, then the program generates other random combinations until it finds a match. This happens so quickly that you can't actually see this verification process.

You may prefer your numbers to be picked from a smaller (or bigger) range of probabilities. In that case, simply select or deselect the probabilities that you don't want.

In the example below, only the best odds are kept, and when you hit The Picker, the picked numbers will always be located on 4 rows and 4 columns.

ROWS

☐ 5 rows = 1: 4.29
☒ 4 rows = 1: 1.91
☐ 3 rows = 1: 4.44
☐ 2 rows = 1: 57.71
☐ 1 row = 1: 12655.98

COLUMNS

☐ 5 cols = 1: 3.38
☒ 4 cols = 1: 1.94
☐ 3 cols = 1: 5.65

Below the Rows/Columns area on the right-hand side of the application, you will find Winslips' **cumulative PROBABILITY calculator**. (New since February 2018!)

It's always "on" and you can get some very useful information from it.

When you select "4 rows" and "4 cols" for example, you will now see the probability of both events happening **at the same time**.

☐ 2 cols = 1: 91.83
☐ 1 col = 1: 28166.7

PROBABILITY: 26.99%

You can select more than 2 options as well.

The calculator's result is always expressed as a percentage (%). If you're not familiar with percentages, here are a couple of examples ...

1% = 1: 100
10% = 1: 10
25% = 1: 4
50% = 1: 2
75% = 1: 1.33
100% = 1: 1

The cumulative probability calculator has an error margin of less than 0.4 percent, which is quite amazing. Looks simple, but it's not when you consider the speed of the projected calculations.

The cumulative probability calculator is purely informative. It spits out great info for users who only play one ticket and use Winslips as a One Ticket System.

How to use Winslips as a One Ticket System?

To use Winslips as a One Ticket System, don't click the INVERT button. It really is that simple!

Personally, when I use Winslips as a One Ticket System, I like to see a cumulative probability of 20% or better. In most cases, that's what you get when you select the 2 best row/column options.

Using The Picker Together With The Reduction Platform.

For your convenience, each "probability" is calculated with the idea that none of the winning numbers are missing from their respective panels.

So, even when you decide to play only one ticket, you could still use The Picker to select a combination that corresponds with the best probabilities. In that sense, you're using WinSlips as the "**One Ticket System**" (*and I guarantee you that these picks are much better than a Quick Pick*)!

But things are starting to get more interesting when engaging the number reduction platform.

Sticking to our Washington DC Powerball example ...

... the moment you hit the INVERT-button, your reduction panels with the missing numbers are created instantly and **dynamically**. This means that your 6 panels won't be exactly the same as my 6 panels, but the guarantee remains the same: the 5 winning numbers together as a group will ALWAYS be located on at least one of the 6 panels.

The reason why I wanted that dynamic aspect is because I wanted the program to be free of my own influence for as much as possible. Adding random dynamics to the combinatorial grouping method, used to obtain the 100% guarantee, was the best solution here.

There are **3 easy steps** to complete the number selection process ...

Step 1

Starting with the first panel, click "**Pick 5+1**" at the bottom of that first panel and The Picker will produce a combination that fits your selected probabilities.

Of course, The Picker will NEVER pick one of the missing numbers to preserve your benefit of using the fail-safe number reduction platform. That's how the Winslips System has been programmed.

Step 2

Next, use the panel navigation button(s) to proceed to the next panel and click The Picker again.

A new combination will appear. Again, none of the missing numbers will be selected, and the produced combination will fit your selected probabilities. If for some reason you don't like that new combination, hit The Picker again to obtain a new combo.

Step 3

Repeat "Step 2" for panel 3, 4, 5 and 6 and you're done!

You now have 6 beautifully created combinations, all taken from a 100% fail-safe reduction platform, each fitting the selected probabilities.

Transfer those combinations to your bet-slips, keep your fingers crossed and wish yourself luck. Those are really the best tickets your money can buy!

In case it frustrates you that there are too many combinations that fit the best probabilities, then consider this:

You're playing a game of chance here, whose outcome is, by definition, strongly influenced by some randomizing device. With the Winslips Lottery Application, it becomes a game of BEST chance.

So try to look at the positive side of things here ...

The vast majority of all jackpot winning tickets from the past - even the ones that were computer generated *or Quick Picks* - correspond with the better than 1 in 10 probabilities that are selected by default.

Embrace that knowledge, praise yourself lucky that you finally know this and feel extremely happy about the fact that you have the only tool available to exploit this. Many players do not have any of that at all!

Chapter 7: Advanced Play

Some players prefer to have some control over their OWN numbers. With the new WinSlips System, you can now exclude numbers you don't want, **and/or** lock numbers you do want.

1. Excluding numbers

When you click on a (black) number it turns **red**, which means you don't want this number to be picked by The Picker.

37	38	39	40	41	42	43	44	45
46	47	48	49	50	51	52	53	54
55	56	57	58	59	60	61	62	63
64	65	66	67	68	69			

This way, you can exclude as many numbers from your panel(s) as you want.

2. Locking numbers

When you click on a **red** number it turns **blue**, which means you ALWAYS want this number to be picked by The Picker.

37	38	39	40	41	42	43	44	45
46	47	48	49	50	51	52	53	54
55	56	57	58	59	60	61	62	63
64	65	66	67	68	69			

Some restriction apply ...

- When engaging the reduction platform, The Picker can only pick numbers from the available group of visible numbers. A MISSING blue number can NOT be picked.
- Depending on the type of game you play, you can only select a maximum amount of blue numbers. The restrictions are:
 - For pick 4, a maximum of 3 visible numbers can be blue
 - For pick 5, a maximum of 4 visible numbers can be blue
 - For pick 6, a maximum of 5 visible numbers can be blue
 - For pick 7, a maximum of 6 visible numbers can be blue

3. Allowing/unlocking numbers again

To unlock a locked **blue** number, click once on the number (*it will turn black again*)

To allow an excluded **red** number, click twice on the number (*it will turn blue, then black again*)

IMPORTANT!!!

Before you exclude or lock certain numbers, I advise you to do this **BEFORE** you engage the number reduction platform. This way you keep a crystal clear overview of the numbers you excluded and/or locked.

There's only **one exception** to the above advise, and that's when using the "MAX-COVER"-bet (*I'll explain that a bit later*) ...

4. Excluding "All Odds", "All Evens", "All Lows" and "All Highs".

I lost count of the number of veteran Winslips users who requested this feature, but if you're a new user, let me quickly show you what this is about ...

Most players know what "odd numbers" are (1-3-5-7-9-11-etc) and what "even numbers" are (2-4-6-8-10-12-etc)

Understanding what "low" and "high" numbers are is even easier ...

Take Mega Million 5/70 format for example.

- The first 35 numbers (1-35) are considered "low numbers"
- The last 35 numbers (36-70) are considered "high numbers"

A lottery game with an uneven amount of numbers can't be split into 2 groups with an equal amount of low and high numbers. Such a game has 1 more "high number" than its amount of "low numbers"

For Powerball with its 69 main numbers ...

- The first 34 numbers (1-34) are considered "low numbers"
- The last 35 numbers (35-69) are considered "high numbers"

Easy, no?

Sticking to our Powerball example, many players prefer to play combinations that have "2 Lows and 3 Highs", or vice-versa: "2 Highs and 3 Lows". It guarantees a good spread of numbers.

The same can be said about odds and evens. Plenty of Powerball players prefer to play combinations that have "2 Odds and 3 Evens" or "2 Evens and 3 Highs".

If that's what you want, then hit The Picker until you see something like this.

O=3	☐	E=2
L=2	☐	H=3

Personally, I think that's a bit too radical, but I did design a less restrictive feature that allows you to easily avoid number combinations that have "All Odds", "All Evens", "All Lows" and "All Highs".

To enable this feature, select the two white checkboxes between O-E and L-H and hit The Picker again.

O=4	☒	E=1
L=2	☒	H=3

That's it!

There are conditions that will be ignored, though. For example, if for some reason you excluded all the odd numbers (see page 23 – Excluding Numbers), then your selected numbers will be "All Even". In this example, the program will IGNORE your request to avoid number combinations that are "all odds" or "all evens".

5. The "MAX-COVER" Bet!

One of my favorite low-budget strategies is playing ALL the numbers in a minimum amount of lines. To give you an example for Powerball USA, one can play ALL 69 numbers in just 14 lines (= 14 lines of 5 numbers).

There's a "so-so" way to do this and there's a "perfect" way to do this.

I have devoted an entire chapter on this low-budget strategy in my book ["If you can't win the lottery then change its rules"](#) (chapter 3, page 28 till page 50), but again ... to preserve the integrity and originality of the WinSlips System, I won't get into this any further.

But with the WinSlips System, we can do something similar and I named this new strategy the "MAX COVER"-bet.

Sticking to our example of Washington DC Powerball, when we engage the number reduction platform, we must pick 6 games.

Six games give us the opportunity to cover a maximum of 30 unique numbers (*or 6 lines of 5 unique numbers*). That's exactly what we will do, but with the MAX-COVER bet, you will AUTOMATICALLY get 6 combinations that correspond with the absolute best odds and probabilities too.

Aren't you getting excited yet?

This strategy involves 6 easy steps after the basic set-up.

Step 1

Hit the INVERT-button ...

Step 2

Select the best odds for rows and columns ...

Step 3

Hit The Picker

Step 4

Click once on ALL the picked numbers. They should turn red (*which means you are excluding them to be picked again in the other panels*)

P2 »

Panel 1/6									
1	2	3	4	5	6		8	9	
10		12		14	15	16	17	18	
19	20	21	22	23	24	25	26	27	
28	29				33		35	36	
37		39	40	41	42	43	44		
46	47	48	49	50			53		
55	56	57	58	59	60	61	62	63	
64	65	66	67	68	69				

Step 5

Use the Panel Navigation Button(s) to move to the next panel, and repeat step 3 and step 4

P2 »

Panel 1/6									
1	2	3	4	5	6		8	9	
10		12		14	15	16	17	18	
19	20	21	22	23	24	25	26	27	

Step 6

Repeat step 5 for all the other panels

You now have six games covering a maximum of 30 unique numbers, and each set of numbers corresponds with the absolute best odds and probabilities.

Troubleshooting Note 1

With the "MAX-COVER"-bet strategy, the amount of available numbers "shrinks" with each consecutive panel. By consequence, there's always a possibility that a certain set of remaining numbers won't be able to produce a combination that corresponds with the best selected odds. When this happens, The Picker simply times-out and gives you a "Failed To Select"-notification.

In that case it is best to click on the "CLEAR"-button and start with Step 1 again.

Troubleshooting Note 2

The "MAX-COVER"-bet strategy needs a work-around for games where the amount of available numbers is too small to FILL up all the panels.

Example

The reduction platform for Pick 7/34 has 8 panels (*note: you'll learn how to set up different types of lottery games in the next chapter*) ...

8 games allow us to cover up to 56 numbers (*8 games x 7 numbers per game*), but there are only 34 numbers available in a 7/34 game.

The first 4 panels will cover 28 of the 34 possible numbers, but by consequence, there will only be a **maximum** of 6 (visible) numbers left in the fifth panel to pick 7 numbers from, which is totally impossible.

Here's the quickest solution:

Give each visible number a "double click". The black numbers will turn blue, the red numbers will turn black.

« P4 P6 »

Panel 5/8					
1		3	4	5	6
7			10	11	12
13	14		16	17	18
19	20	21	22	23	24
25	26	27	28	29	30
31	32	33	34		

Pick 7

By doing so, you "lock" all the visible numbers that weren't picked yet (blue), and you "allow" all the other visible numbers to be picked again (black).

When you now hit The Picker, the blue visible numbers that weren't picked yet, will be combined with any of the other numbers. If you get a "failed to select" message then please refer to Troubleshooting note 1, or try to keep just 1 or 2 blue numbers at the time for each of the remaining panels. The only limit here is your own imagination.

Chapter 8: Select Your Lottery Game!

So far, we covered how WinSlips deals with Powerball USA. Other lottery games are dealt with in exactly the same way.

In this chapter, let's visually summarize the whole process of how to use the WinSlips System for just about any pick 4, pick 5, pick 6 or pick 7 game.

Step 1: Basic Set-up

You have to do this in this order ...

- (a) "How many numbers are drawn from the main pool of numbers?"
- (b) "How many lottery balls are spinning around in the main drum?"
- (c) "Are one or more extra numbers drawn from a separate pool of numbers?"
- (d) "How many extra balls will be drawn" ...
- (e) ... "from how many possible numbers?"
- (f) "How many columns does one individual panel on your local lottery form have?"

The diagram shows a form for selecting a lottery game. Callout 'a' points to the 'Pick 4' dropdown. Callout 'b' points to the '45 numbers' dropdown. Callout 'c' points to the 'Add extra bonus' checkbox. Callout 'd' points to the 'and 1' dropdown. Callout 'e' points to the '11 numbers' dropdown. Callout 'f' points to the '6 columns' dropdown. The form also includes a 'Panel Layout' dropdown and a 'Panel Indent' section with '+' and '-' buttons.

Step 2: Advanced Settings (optional)

- (g) "Will you exclude certain numbers?"
- (h) "Will you lock certain numbers?"

The diagram shows a grid of numbers from 14 to 29. Callout 'g' points to the number 14, which is highlighted in red. Callout 'h' points to the number 29, which is highlighted in blue. The grid is arranged in four rows and four columns.

14	15	16	17
20	21	22	23
26	27	28	29

Step 3: Play options

(i) "Will you use the Number Reduction Platform?"

I. No?

- You have to play 1 ticket

II. Yes?

- You have to play 5 tickets (pick 4)
- You have to play 6 tickets (pick 5)
- You have to play 7 tickets (pick 6)
- You have to play 8 tickets (pick 7)

Step 4: Pre-calculated Probabilities

(j) "Will you use the default selections?"

(k) "Will you select/deselect a bigger or smaller range of pre-calculated probabilities?"

Step 5: Picking numbers

(l) "Is the number reduction platform in use?"

I. No?

- Hit The Picker once (*)

II. Yes?

- Hit The Picker once (*) per panel - navigate between the panels with the panel navigation buttons

(*) *If you want a more evenly distribution of numbers (odds-evens & lows-highs), then select the two white checkboxes that appear below The Picker, and hit The Picker again until you get what you want.*

Step 6: The Easiest Step!

Simply transfer your combination(s) to your bet-slip(s), keep your fingers crossed and hope for the best!

In case you wonder if you should play your ticket(s) for one drawing or for several drawings, here's some solid advice ...

I think that really depends on what kind of lottery player you are!

If you decide to play the same ticket(s) over and over again, then there's a chance it will become an obsession NOT to miss a single draw. I've been there, done that, and I know what I'm talking about.

As for now, I pick new numbers each draw, and I don't EVER look back. This way, I don't feel obliged to play the game each draw of the week (*which is indeed the case when players stick to the same set of tickets for ever*). I also believe it minimizes my chances to hold on to a set of tickets that won't win the big one.

Side-Note about the produced bonus numbers!

In case your local lottery game draws 1 or 2 bonus numbers from a separate drum...

The bonus numbers that the WinSlips Application selects are random numbers. That's because bonus numbers have no row/column advantage. They really are just a matter of pure luck.

That's not a limitation of the Winslips Application, it's just a consequence of the fact that (1) bonus numbers are drawn from a separate pool of numbers and (2) only one or two bonus numbers are drawn which makes it impossible to find a true combinatorial advantage. There simply is none, and the lottery game organizers do know that ;-)

Chapter 9: Unusual Lotto Forms

Some lottery forms or play-slips do have an unusual lay-out. In many cases, the WinSlips application can handle these as well.

1. Forms with Text-Indentation

Some play-slips like the one you see below are characterised by a typical first-row text-indentation.

What to do ...

Panel 1/1						
			1	2	3	4
5	6	7	8	9	10	11
12	13	14	15	16	17	18
19	20	21	22	23	24	25
26	27	28	29	30	31	32
33	34	35	36	37	38	39
40	41	42	43	44		

Pick 4+1

During the Basic lay-out set-up, there's one extra step involved. Simply use the **"Panel-Indent (+)"**-button. With each click, you move the numbers on the first row one space to the right.

In case you moved the numbers too far to the right, you can correct the problem with the "**Panel-Indent (-)**"-button.

Important Side-Note!

When you use the panel indent feature, the numbers on the first row and (*some of*) the numbers on the last row(s) will turn yellow. When this happens, then all yellow numbers are treated by the program as one row.

In the example below ...

- numbers 1, 2, 3, 4, 42, 43 and 44 are treated as 1 row (*row 1*)
- numbers 40 and 41 - *only 2 numbers* - are also treated as one row (*row 7*)

Panel 1/1						
			1	2	3	4
row 2	5	6	7	8	9	10
row 3	12	13	14	15	16	17
row 4	19	20	21	22	23	24
row 5	26	27	28	29	30	31
row 6	33	34	35	36	37	38
row 7	40	41	42	43	44	

The table shows a 7x7 grid of numbers. The first row (row 1) is highlighted in yellow and contains numbers 1, 2, 3, and 4. The last row (row 7) is also highlighted in yellow and contains numbers 40, 41, 42, 43, and 44. A red bracket on the right side of the table groups the first row and the last row together, labeled 'row 1'.

- numbers 2 and 42 are located on one (yellow) row and 2 columns.

Panel 1/1						
			1	2	3	4
5	6	7	8	9	10	11
12	13	14	15	16	17	18
19	20	21	22	23	24	25
26	27	28	29	30	31	32
33	34	35	36	37	38	39
40	41	42	43	44		

The table shows the same 7x7 grid of numbers. The first row (row 1) is highlighted in yellow and contains numbers 1, 2, 3, and 4. The last row (row 7) is also highlighted in yellow and contains numbers 40, 41, 42, 43, and 44. In this version, the numbers 2 and 42 are circled in red, indicating they are located on one (yellow) row and 2 columns.

I realize that this is not an ideal solution and maybe a bit confusing, but it won't make any difference to you when it comes to having a combination to match the best odds. All pre-calculated probabilities are 100% respected here.

In case you're a mathematician and wonder if **2 of the picked numbers** could be located on 1 yellow row **AND** on 1 and the same column as in the picture below ... the answer is "NO".

Panel 1/1						
		1	2	3	4	
5	6	7	8	9	10	11
12	13	14	15	16	17	18
19	20	21	22	23	24	25
26	27	28	29	30	31	32
33	34	35	36	37	38	39
40	41	42	43	44		

The program is instructed not to make that possible. Just like with "normal" rows and columns, two numbers on one row can never share the same column (*and vice-versa*).

2. Forms with a Different Text-Orientation

If your lottery game's play-slip uses a different text-orientation - *numbers can be sorted vertically or can be orientated from right to left for example* - then try to produce a mirror-image of that play-slip during the basic set-up. It won't make any difference to the pre-calculated odds and probabilities. It really is exactly the same thing!

I give you one example: Canada's Lotto 649 ...

You can look at rows as columns (and vice versa). It really doesn't matter for the odds. It's just a different text orientation, nothing more.

See it this way ...

On the official form, we see this layout (simplified):

```
01 08 15 22 29 36 43
02 09 16 23 30 37 44
03 10 17 24 31 38 45
04 11 18 25 32 39 46
05 12 19 26 33 40 47
06 13 20 27 34 41 48
07 14 21 28 35 42 49
```

When we turn the form 90 degrees to the left, we see something like this:

```
43 44 45 46 47 48 49
36 37 38 39 40 41 42
29 30 31 32 33 34 35
22 23 24 25 26 27 28
15 16 17 18 19 20 21
08 09 10 11 12 13 14
01 02 03 04 05 06 07
```

Which is exactly the same as this (only the rows are in reverse order from top to bottom):

```
01 02 03 04 05 06 07 ← ... and that's the format you need to select!
08 09 10 11 12 13 14
15 16 17 18 19 20 21
22 23 24 25 26 27 28
29 30 31 32 33 34 35
36 37 38 39 40 41 42
43 44 45 46 47 48 49
```

3. Other Unusual Forms and "Virtual" Forms

Some lotto games have game panels with more than 20 rows or columns. Other games have a double text indentation or even a vertical text indentation.

Virginia's "Bank A Million" for example is a game where all 40 numbers are placed on one row. Another example is South Carolina's "Lucky For Life". That game has 2 rows that are indented with 2 spaces.

In either case, you need to set up a Virtual Form.

As a rule of thumb, try to mimic a square or anything that comes close. For Bank A Million for example, select 7 columns and 6 rows OR 6 columns and 7 rows. For lucky for life, a 7 column layout - without indent - is what you're after.

This works out just great, but it is important that - once you use a virtual form - that you stick to your chosen 'virtual layout' each time you play.

Chapter 10: Printer Settings

When you engage the number reduction platform, you can only see one panel at the time. The reason for this is that the available "screen-estate" on your smartphone, tablet, desktop or laptop computer is somehow limited. But as you already know, you can use the Panel Navigation Buttons to "jump" from one panel to another.

However, I thought it would be nice to make it possible to print ALL the panels at once with a simple click on the button. Rest assured, I made that possible but you have to make sure that you're using one of the suggested browsers and that your browser's printer settings are set correctly.

Internet Explorer - IE9 and UP...

From within the IE9 browser, hit the "ALT"-button to display the toolbar. Click "File", then click "Print Preview".

Click on "Page Setup" on the preview page and make sure that "Print background colors and images" are checked.

For high number games like lotto 6/90, it might be a good idea to put the printing scale to 70% if you want to print all the panels on one page. For the configuration of older and newer versions of Internet Explorer, have a look at this [Google Search](#).

Firefox

Click "File", then click "Print Preview". Click on "Page Setup" on the preview page and make sure that "Print background (colors & images)" are checked.

Again, for high number games, you might consider to put the printing scale to 70% if you want to print all the panels on a single page. For the configuration of older en newer versions of Firefox, have a look at this [Google Search](#).

Other Browsers

For other browsers, please check the online documentation to see if and how to enable the printing of background colors and images. At the time of writing, the [Chrome browser](#) has that option too.

Chapter 11: Conclusion (and what to expect) ...

Congratulations. You've made it this far. Now that you're more or less familiar with the key features of the WinSlips System, you probably want to snap one of those big fat jackpots instantly, right?

Excellent! That's the spirit, but ...

... before you get started with what I believe is the ABSOLUTE best lottery system for low budget players, I want to be absolutely sure that you fully understand what jackpot games are all about ...

1. Be happy that jackpot games are tough to win

Jackpot games are tough games to win, and maybe no-one ever told you that, but that's how those huge jackpots grow each day. Be happy for that!

2. Stick to your budget

The more lottery tickets you play, the more chances you have to win small prizes. However, small prizes should not excite you at all. They are simply there to keep your playing habits alive. They certainly won't cover your bills. Accept the fact that, unless you win the jackpot or a big second prize, a lotto game is - and always will be - a negative expectancy game. The more money you wager, the more money you'll lose in the long run (*even when you win the occasional small prize*). So stick to the WinSlips system and play no more than 6 to 8 tickets.

3. It's not just luck!

It's critically important to play lotto intelligently. It's not just luck. That's what Winslips is all about. Of course, you'll need luck too, and lots of it. But there's no reason to feel sorry about that: every human being on this planet gets an equal share of luck; if not, we wouldn't be born or be alive (*if you seriously think about it, the chance that we are what we are is many times smaller than the chance of winning a big fat lottery jackpot, but it did happen to all of us*).

4. Think positive

Positive expectations make things happen. By using the WinSlips system consistently, your subconscious mind knows it's doing the right thing. Try to feel good about the game you're playing. Try not to feel desperate when you lose and accept your losses.

After all, you're doing the right thing, you know you can afford to lose each bet until you win that big one, you realize that each small loss goes to that growing jackpot, and there's always that next draw to win it.

Finally, ...

... to conclude this manual, I would like to tackle **ONE BIG lottery myth!**

Many lottery players think that "winning a jackpot" is a "gradual" thing ... thinking they should be able to slowly build up the amount of correct numbers until they win the big one: one week 3 correct numbers, then a couple of weeks later 4 correct numbers, then a few months later 5 correct numbers, and hopefully a jackpot next year.

Jackpots aren't won this way! They are suddenly there, even after long strikes of bad luck. So don't you ever think you are in bad luck because you're not winning a couple of bucks now and then. It could very well be EXACTLY the opposite of what you might be thinking.

You know the saying ... "small prizes keep losers happy and poor" ... ? Well, that's exactly what small prizes do!

This may be the best kept secret, but if you ever decide to put your money on a system that guarantees you a small prize, ... then realize that many systems INCREASE your chances to win a small prize while DESTROYING your chances to win the jackpot. It's really the one or the other, not both, and your overall return will be less than 10% of what you spend on many hundreds of tickets.

Don't become that loser! Stick to your acquired Winslips' logics and aim for that jackpot. Picking numbers from fewer numbers will ALWAYS be easier than picking an equal amount of numbers from more numbers. And that's exactly the kind of service that Winslips provides!

One more thing! Like I suggested before: there could be more between heaven and earth than what meets the eye ...

The simple fact that WinSlips crossed your path may not be just a coincidence.

Maybe it's part of your destiny to win a BIG prize, soon or late.

I did my part, now it's your turn!

More power to you, and ...

To your success,

Stefan Vandeveld
www.winslips.com
